JAVA 1995, sun Microsoft launch.

a programming language, can make Desktop, web, mobile apps, Embedded Software, Enterprise ~~Software~~ Appl<sup>n</sup>.

### \* JAVA Features:

- 1) Machine Independent / Architectural Neutral. eg: C int 2 byte, 4 byte 32bit 64bit  
↑ ↑
- 2) Platform Independent ~~code~~ (work on Windows, Linux, MacOSX).
- 3) Portable (can be shared easily due to above 2).

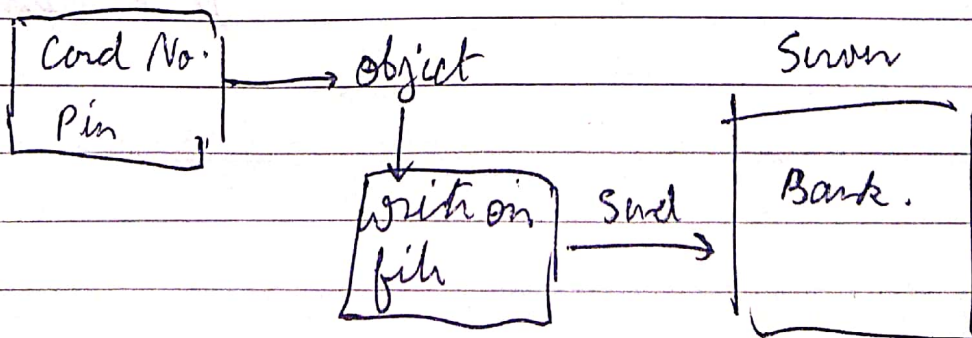

JVM → responsible to convert byte code to machine code.

### ii) Distributed:

- ↳ RMI (Remote method Invocation)
- ↳ EJB (Enterprise Java Beans)

eg:

5) Robust - Strong

There is no pointer leakage problem in Java.

6) Secure -

7) Multi-Threading :

Process

memory + Resource

Thread -

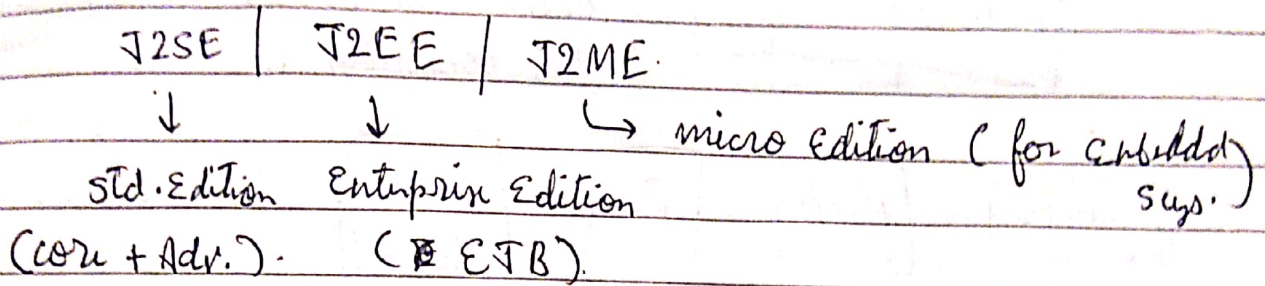

is a light weight Process and part of process.

Every Thread use same memory + Resource as the Process

JDK → Java Development Kit

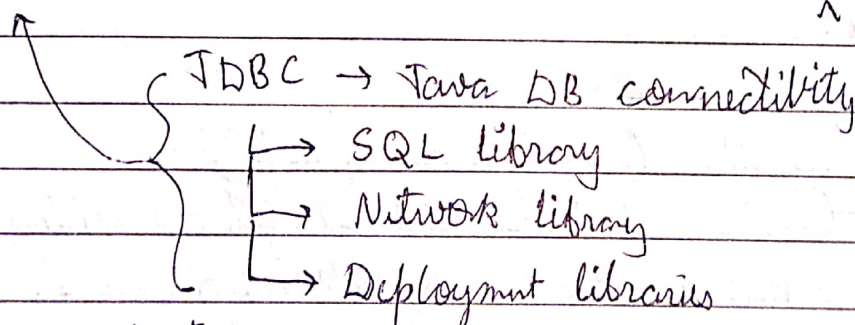

Path of Installation:

C:/Program Files/Java/Jdk1bin X

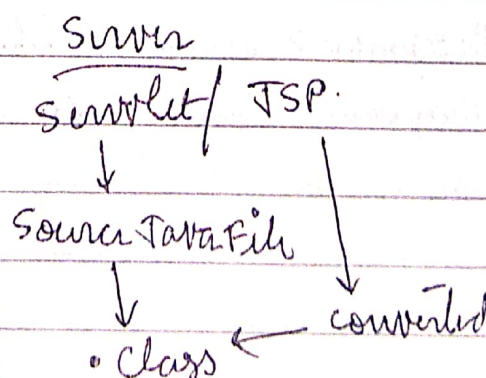

C:/Java/Jdk/bin. ✓ (for ease)

Save files in D, E, F files as only C drive only gets corrupted.

JRE → Java Runtime Environment (Instance of JRE)

Desktop  
JRE  
local machine

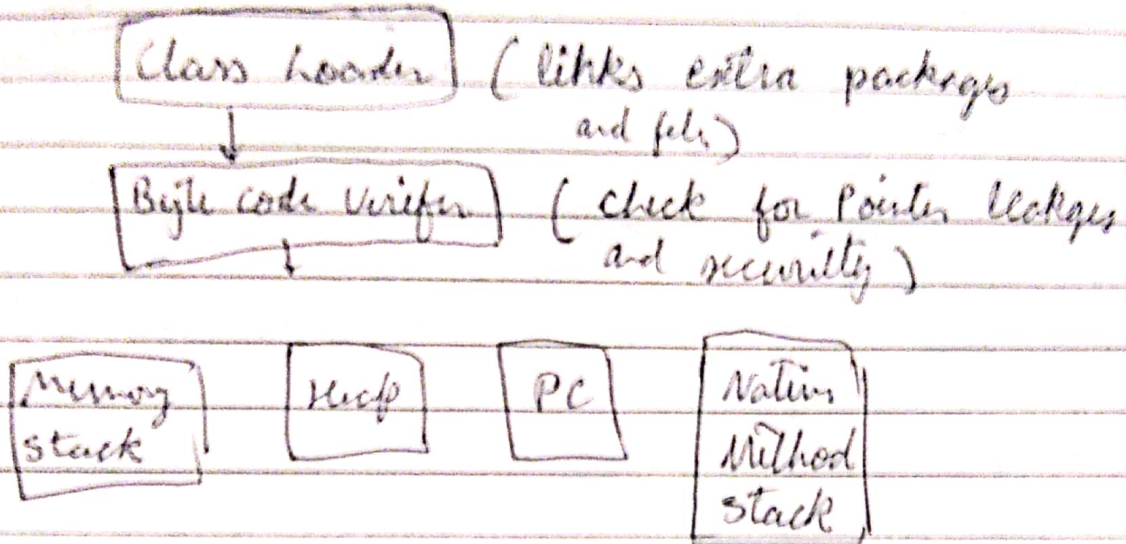

~~generally~~  
compile: source code to byte code  
Interpret: byte code to machine code.

Java is both compiled and interpreted.

JVM

(To store C/C++ code which is converted in byte code)

JVM is platform dependent.

Windows: C:\Java\jdk1.5.0\bin  
store files in E:\JavaPrograms.

open cmd.

C:\> E: ↵

E:\> cd JavaPrograms ↵

E:\JavaPrograms> dir (not necessary step)  
in linux ← (ls) (it will list all files and folders)

E:\JavaPrograms> Path = C:\Java\jdk1.5.0\bin ↵

E:\JavaPrograms> javac First.java

E:\JavaPrograms> java A

→ The class containing main method

First.java

```
class A {  
    void main() { }  
};
```

Class is blue print of object  
object is instance of any class

Class is a blueprint which has some specific properties  
obj is a instance of a class in real world which posses or hold.  
class properties.

First, Java

everything is inside a class in java.

class First {  
    return type  
    method name  
    array of string class obj  
    Public static void main (String s[]) {  
        System.out.println ("Hello world");  
        System.out.print (" demo of Print ");  
        System.out.println (" second demo of Print ");  
    }  
}

11 Sudo apt-get install openjdk; (to install openjdk or  
~ Linux)

( on terminal in Linux .Java-Version to check if is installed  
or not ).

System.out.println() → have new line at end.

System.out.print() → don't have '\n' in end.

(Ctrl + Alt + t) → Shortcut for Terminal in  
Linux.
